AI正在重塑编程

- 在讲AI Coding前，目前对于事务性的文档或PPT，大家是不是都是AI Generated?
- Guns don't kill people, people kill people.
- 使用AI Coding是人类自己的选择，机器并没有代替人类来做这个决策。
- 系统可用与系统可维护性、系统的安全性哪个更重要?
- 使用AI Coding参与开源，更是人类自己的选择。
- 目前，还缺少完全可信的客观性评价，来判定一个PR到底是不是AI Generated，误判容易造成社区对立。

AI正在重塑编程

- 示例: <https://github.com/opencontainers/runc/pull/5184>
- 这个PR涉及文件变更125个, 新增代码8千多行, 减少代码1万多行, 如何判定他是不是AI?
- 使用AI辅助写这个PR是有意义的!

AI正在重塑编程

观点1: 需要人类AI Coding Usage分级定义:

- L1 - AI Assistant: 点选、Tab;
- L2 - AI Copilot: 互动, 结对编程;
- L3 - Vibe Coding: 沉浸式, 人类编码少;
- L4 - Spec Coding: 通过规范指挥AI进行编程;
- L5 - Agentic Coding: AI自主。

AI正在重塑编程

对于开源贡献领域：

- AI生成的代码到底是不是你的代码？
 - L1 - L2：有人类Coder的思考，人类Coder是主程，AI的作用类似于LSP，所以完全是你的代码；
 - L3 - L5：角色互换，AI是主程，人类是辅助，代码所有权不是人类，但是指挥AI的过程是人类。
- **观点2：** 开源平台需要做出改变
 - 改进PR流程，让L3 - L5级别的贡献者，可以提交指挥AI的过程作为辅助材料供评审（人类/机器）；
 - 同时，能根据特征，自动打上AI标签，例如“User_Agent”？

AI Coding现状 (一)

- [Almost Half of AI-Generated Code Fails in Production](#) (2026-05-15)
- [*The State of AI-Powered Engineering Report 2026*](#) (Lightrun):
- 77% of engineering leaders lack confidence in current observability stacks to support automated root cause analyses and remediations.

AI Coding现状 (一)

- **Reliability Issues:** 43% of AI-generated code requires manual debugging in production, even after passing QA and staging tests .
- **Verification Bottleneck:** 88% of organizations require 2-3 manual redeploy cycles to confirm a single AI-generated fix works .
- **Developer Time:** Developers spend an average of 38% of their week (about two days) on debugging, verification, and troubleshooting .
- **Trust Deficit:** 77% of leaders lack confidence in current observability systems to support automated root cause analysis .
- **Visibility Gap:** 60% cite lack of runtime visibility as the primary bottleneck in resolving incidents.

AI Coding现状（二）

While AI can accelerate development, without proper controls it currently introduces substantial, measurable security risk. (2026-05-01)

AI Coding现状（二）

[Veracode, in its 2025 GenAI Code Security Report, reported that AI-generated code caused security flaws in 45% of tests.](#)

指标描述	2025年数据	2026年数据	变化趋势
处于“高风险区域”的漏洞比例 (高严重性 + 高可利用性)	8.3%	11.3%	 激增36%
背负“安全债务”的组织比例 (已知漏洞未解决超过1年)	74%	82%	 增加11%
背负“关键安全债务”的组织比例 (严重且极易被利用的长期漏洞)	50%	60%	 增加20%

AI Coding现状（二）

- [Use of AI coding assistants has surged, but so has the number of vulnerabilities in AI-generated code.](#)
- The Georgia Tech researchers started their measurements on May 1, 2025, and as of March 20, 2026, the CVE scorecard reads:
 - 49 for Claude Code (11 critical)
 - 15 for GitHub Copilot (2 critical)
- In March, they identified 35 CVEs – 27 of which were authored by Claude Code, 4 by GitHub Copilot, 2 by Devin, and 1 each by Aether and Cursor.
- Example: n8n workflow任意文件下载漏洞（纯Claude引入）
 - <https://vibe-radar-ten.vercel.app/cves/CVE-2025-55526>
 - <https://github.com/Zie619/n8n-workflows/commit/ff958e486e1f8de4f7fd43c70ef357b8d6eaf433>
