

A server room with rows of black server racks. Overlaid on the scene is a complex network of glowing blue lines connecting various points. Several of these points are shaped like human brains, rendered in a circuit-like, digital style. The lines and brain icons create a sense of a global or interconnected network, likely representing AI or data flow. The overall color scheme is dark with bright blue highlights.

AI IS CHANGING THE OPEN SOURCE COMPLIANCE LANDSCAPE

ZHU ZHONGHUA

Open Source Compliance Basis

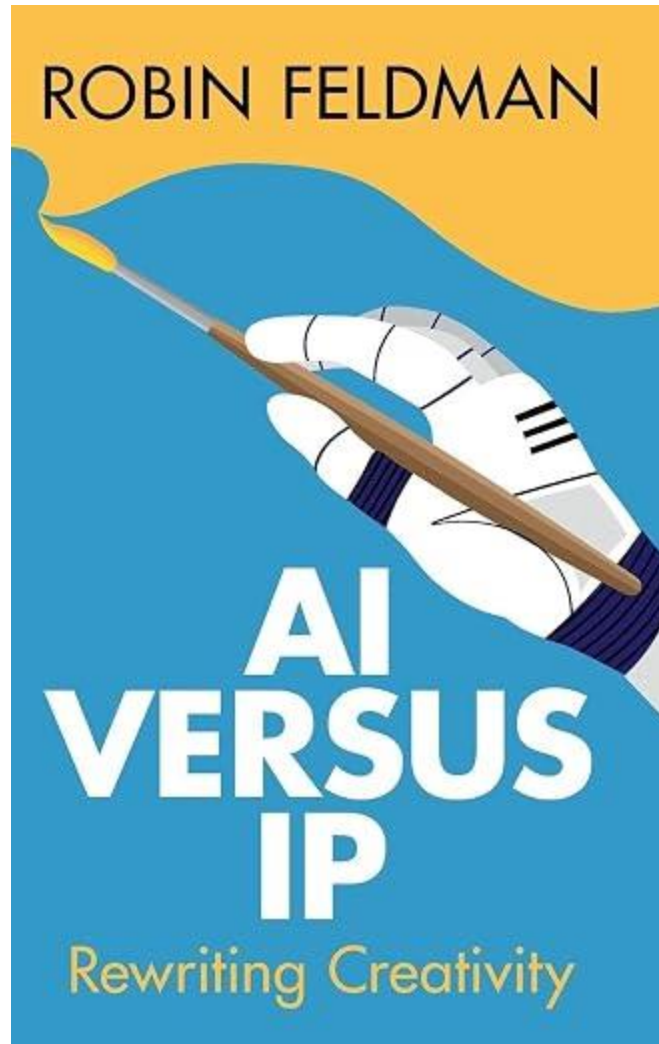

Why :

Software is inherently protected by copyright, and any unauthorized use constitutes infringement. The requirements of the OSS license must be satisfied; failing which, the license granted thereunder is automatically terminated.

How :

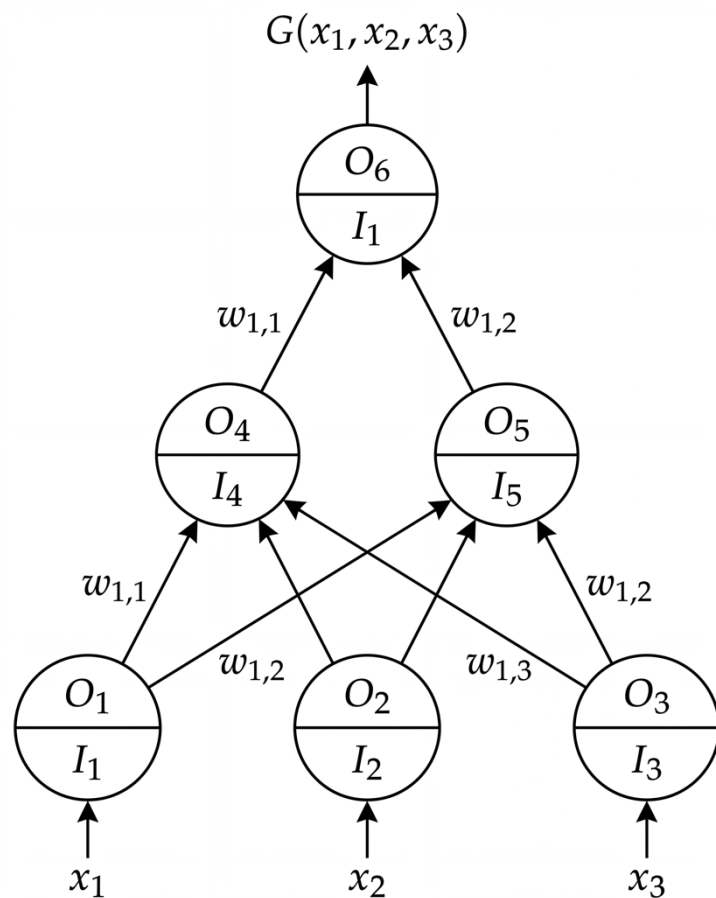

- Identify the open source software to be used
- Determine the license requirements and the intended usage
- Tell whether the software can be used in compliance with the license requirements:
 - If yes, proceed to fulfill the obligations(if any) set out in the license
 - If no, do not use the open source software, or obtain additional (separate) license

AI is changing IP

The rise of artificial intelligence is challenging the foundations of intellectual property. In *AI versus IP: Rewriting Creativity*, science writer Robin Feldman offers a balanced perspective as she explains how artificial intelligence (AI) threatens to erode all of intellectual property (IP) – patents, trademarks, copyrights, trade secrets, and rights of publicity.

Uncopyrightable New software-Model weights

Model is eating software, while model weights may not be eligible for copyright

Uncopyrightable New Software-AI generated code

More code is generated by AI, which may not be copyrightable either

Other IP rights?

Other IP rights may not be available either

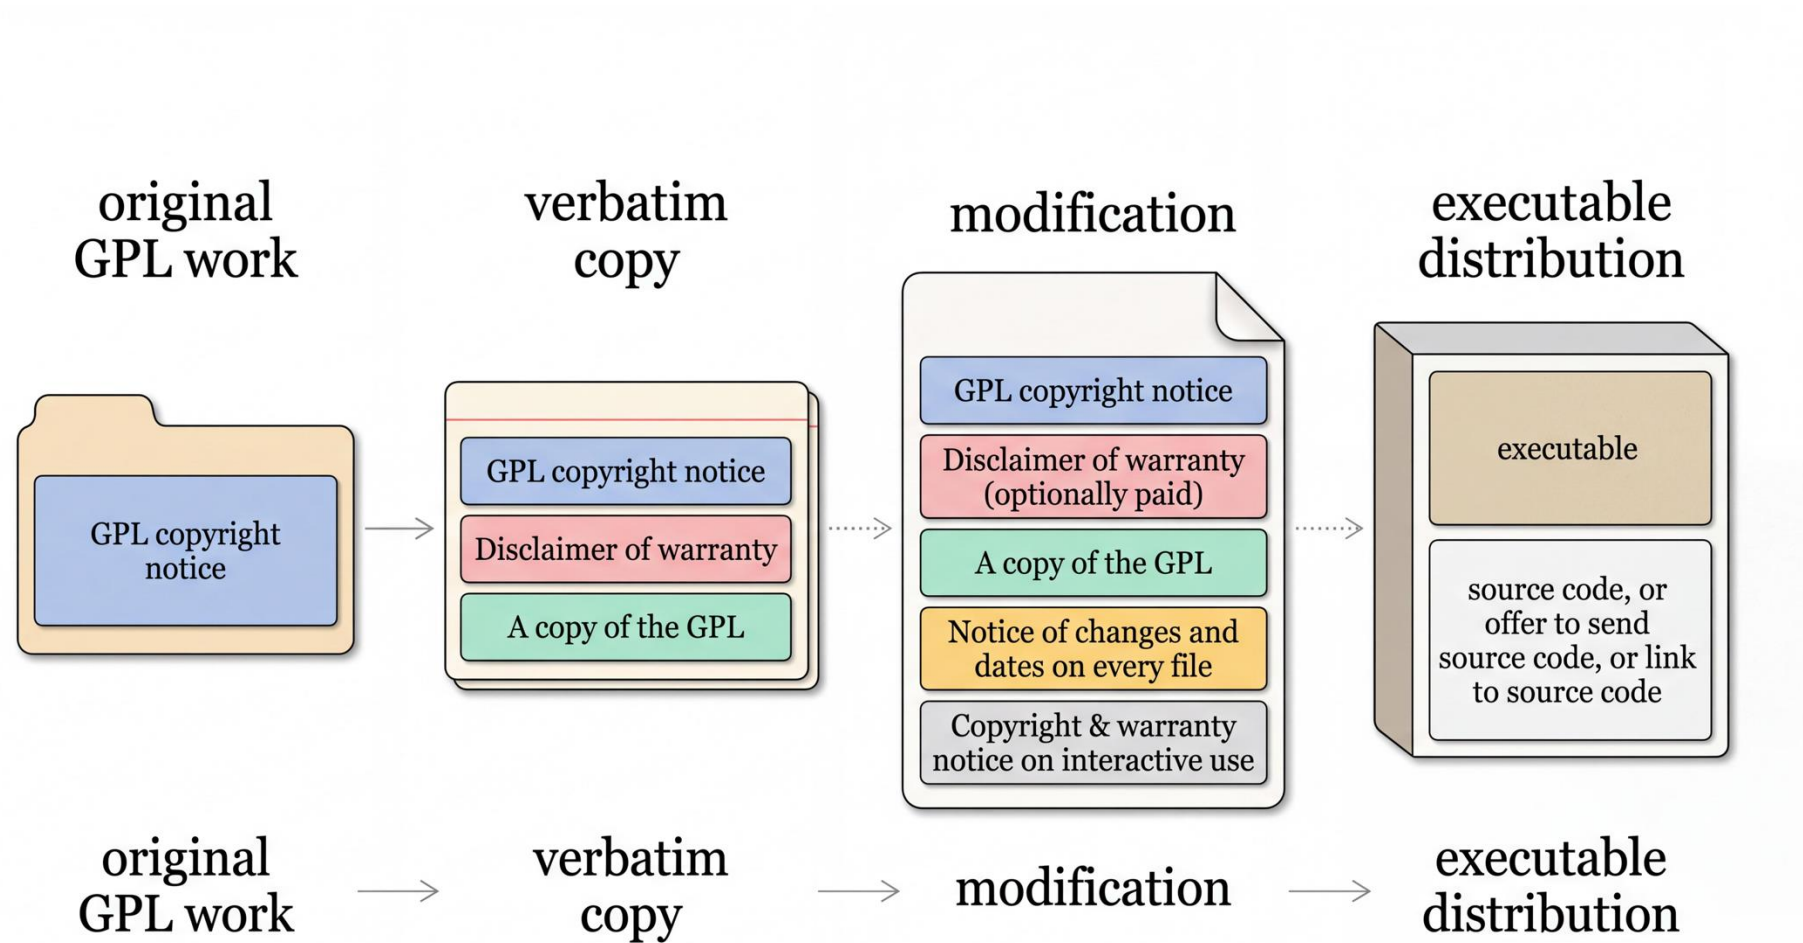

Breaching of contract?

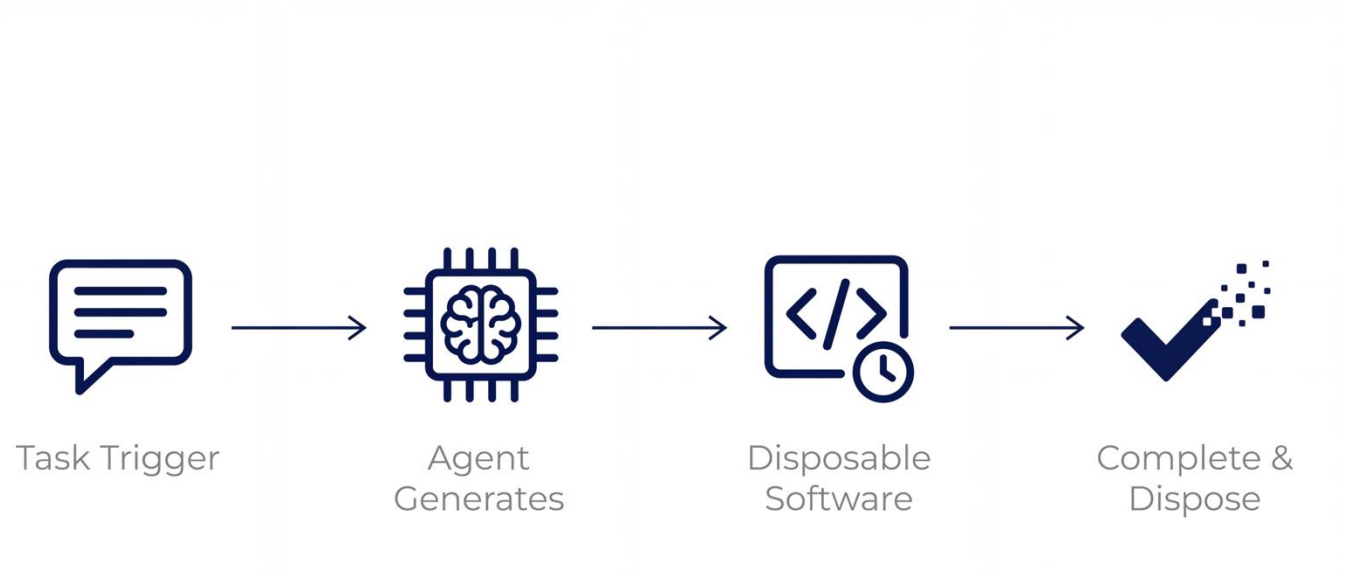

Whether a contract is formed at all, particularly where the user never noticed the license;

Even if a contract is formed, it should not be used to expand the categories of IP protection, granting IP protection to information that would otherwise fall outside the scope of IP protection.

License obligations are usually triggered by modification and redistribution

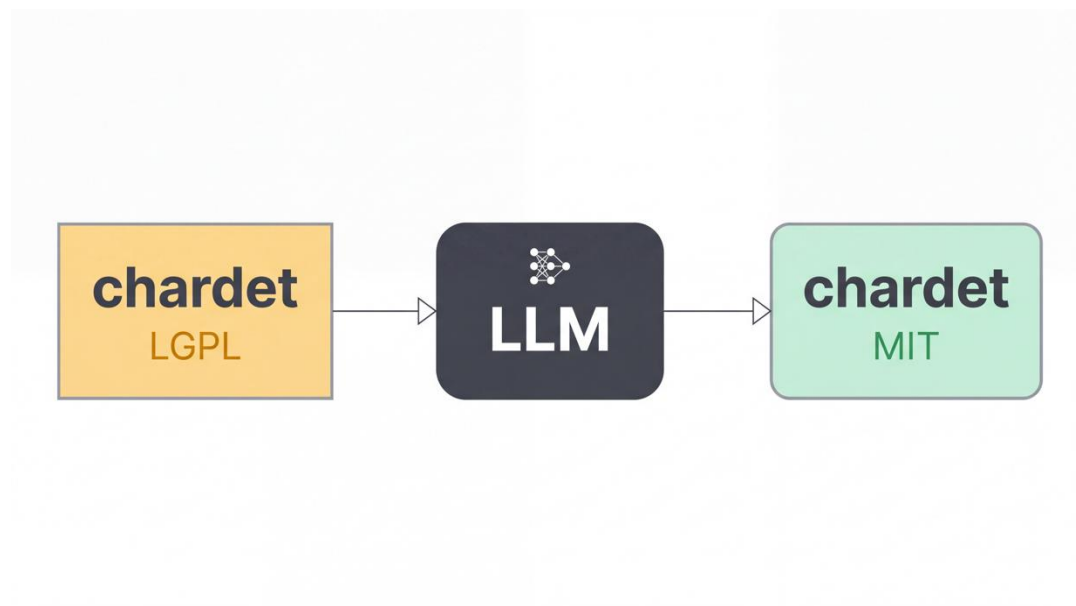

Software used in Agentic AI task

Packages used in agentic AI tasks are dynamically pulled in and integrated by the LLM agent at runtime. In many cases, they are downloaded directly from public package registries and then distributed to the end-user's device, where applicable.

License Laundering ?

Derivatives: If the similarity is low enough, is the new software a work based on the original software/derivative?

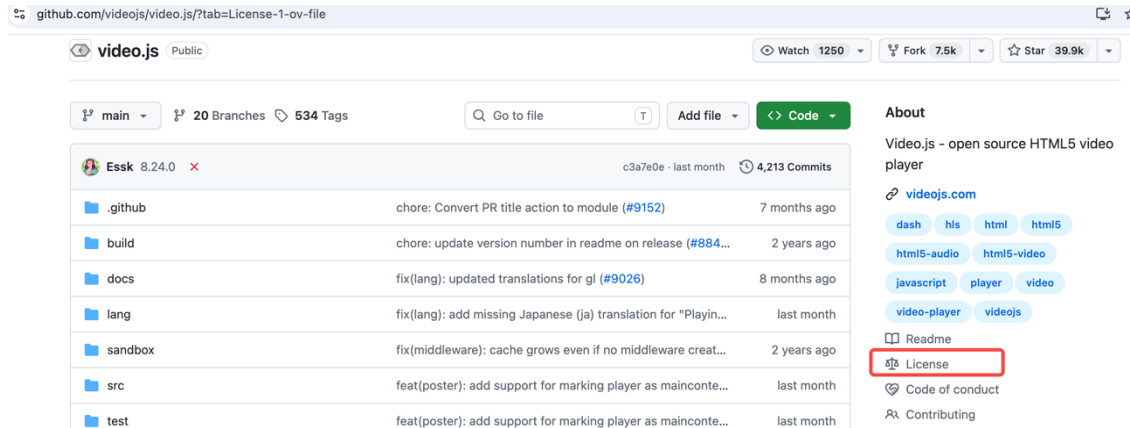

Attribution: If the similarity is low, whether Attribution is still needed.

AI enabled/powered open source compliance

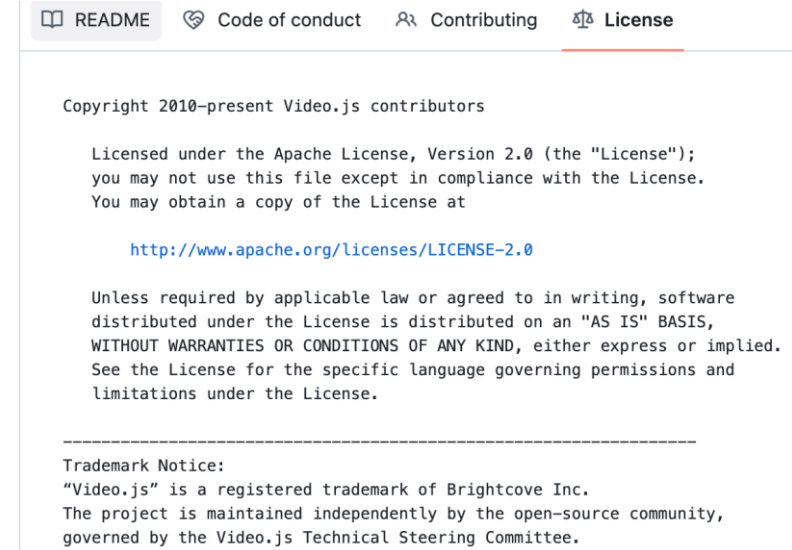

AI can help to make open source compliance more efficient.

AI empowered open source compliance tools

The screenshot shows the GitHub repository for video.js. The repository is public and has 1250 watches, 7.5k forks, and 39.9k stars. The file tree on the left shows folders like .github, build, docs, lang, sandbox, src, and test. The 'About' section on the right describes the project as an open source HTML5 video player. The 'License' tab is selected, showing the Apache License, Version 2.0.

File	Commit Message	Time
.github	chore: Convert PR title action to module (#9152)	7 months ago
build	chore: update version number in readme on release (#884...	2 years ago
docs	fix(lang): updated translations for gl (#9026)	8 months ago
lang	fix(lang): add missing Japanese (ja) translation for "Playin...	last month
sandbox	fix(middleware): cache grows even if no middleware creat...	2 years ago
src	feat(poster): add support for marking player as mainconte...	last month
test	feat(poster): add support for marking player as mainconte...	last month

The screenshot shows the 'License' tab of the video.js repository. It displays the Apache License, Version 2.0 text, which states that the software is distributed under the License on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. The license text is followed by a trademark notice for Video.js.

Building new automation tools with AI

Figure out license risks related to usage of Agent Skill, and develop a license compliance tool (something like SCA) for me; Before you develop the software, show me the research result and the workflow of the license compliance tool in English

今天 15:35    

梳理Agent Skill合规需求 >

I'll research the Agent Skill ecosystem, license risks, and SCA tool architecture, then present findings and a workflow before building. Let me start by exploring the actual Skill structure and conducting parallel research.

梳理Agent Skill结构 >

Good, I can see the Skill ecosystem structure. Let me dig deeper into Skill metadata, license files, and conduct research on SCA tools and license risks.

推进合规工具相关工作 >

Key findings: 104 skills, 2419 files, only 7 have LICENSE files. Let me examine the existing licenses, dependency manifests, and SKILL.md metadata structure, plus research SCA architecture.

调研合规工具相关信息 >

Let me examine dependency contents, inter-skill references, and research license risk taxonomy and SPDX standards.

已完成调研准备 >

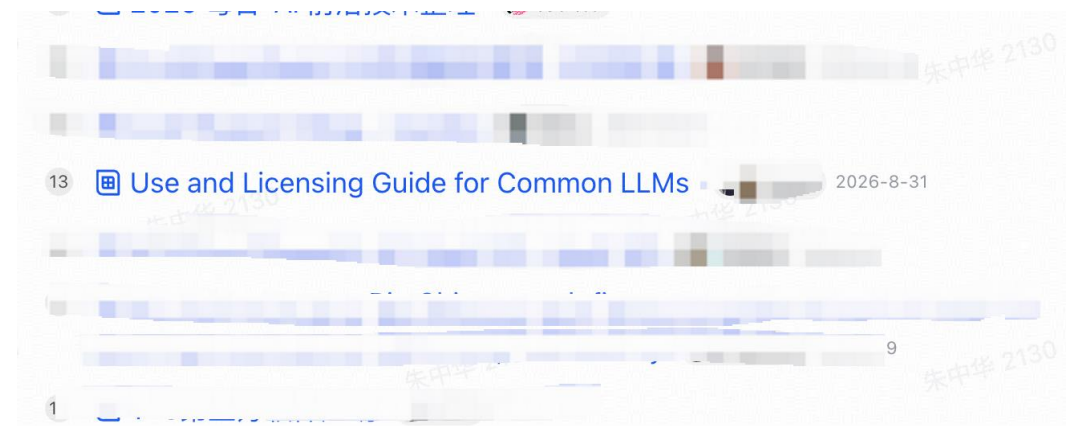

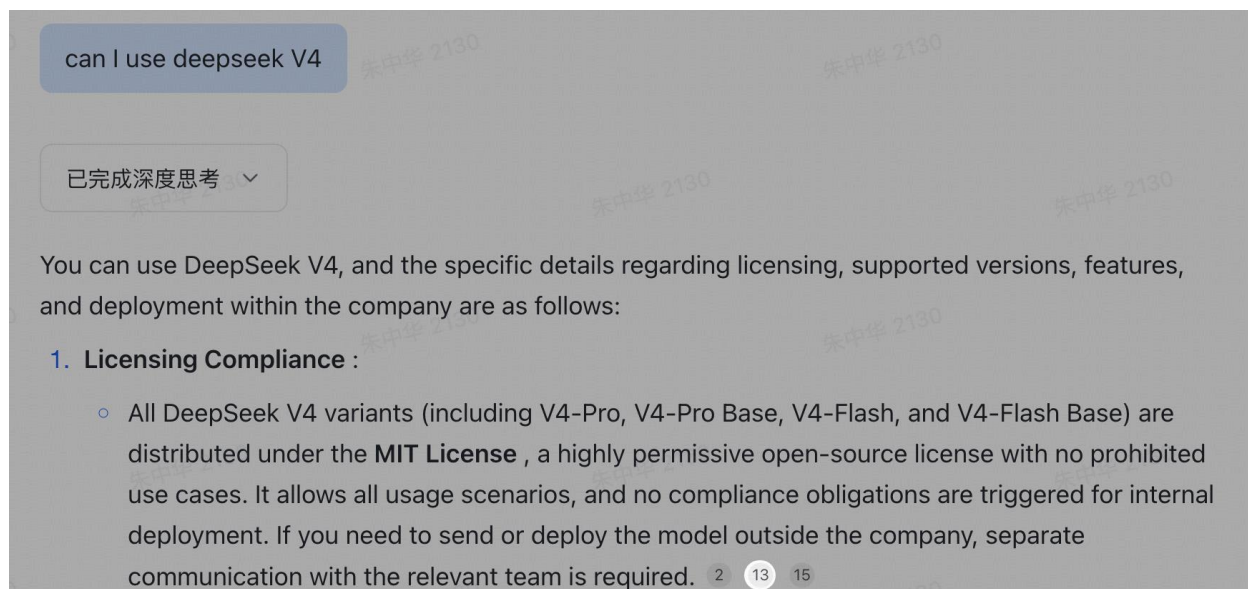

Let me do a few final targeted checks on code-level license headers and the lark skills directory, then compile the research.

已获得充足信息 >

I now have comprehensive data. Let me read the visualization skill to create a proper workflow diagram, then present the full research findings.

For certain new compliance scenarios that the industry has yet to address with mature tools, AI can also be used to build compliance tools of our own.

AI helps to promote awareness

AI helps raise compliance awareness: colleagues can now ask AI about open source software and get answers grounded in the company's internal policies—provided those policies are reliable and well-structured enough for AI to index.

THANKS!
